## 5 SAR Evaluation

### 5.1 RF Exposure Compliance Requirement

#### 5.1.1 Standard Requirement

According to KDB447498D01 General RF Exposure Guidance v06

##### 4.3.1. Standalone SAR test exclusion considerations

Unless specifically required by the published RF exposure KDB procedures, standalone 1-g head or body and 10-g extremity SAR evaluation for general population exposure conditions, by measurement or numerical simulation, is not required when the corresponding SAR Exclusion Threshold condition, listed below, is satisfied.

#### 5.1.2 Limits

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq 50$  mm are determined by:

$$\left[ \frac{(\text{max. power of channel, including tune-up tolerance, mW})}{(\text{min. test separation distance, mm})} \right] \cdot \sqrt{f(\text{GHz})} \leq 3.0 \text{ for 1-g SAR and } \leq 7.5 \text{ for 10-g extremity SAR, where}$$

$f(\text{GHz})$  is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest mW and mm before calculation<sup>17</sup>

The result is rounded to one decimal place for comparison

The test exclusions are applicable only when the minimum test separation distance is  $\leq 50$  mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is  $< 5$  mm, a distance of 5 mm is applied to determine SAR test exclusion

#### 5.1.3 EUT RF Exposure

For Antenna 1: the nearest distance of antenna to the human ear is 7.23mm, as shown below:

The Max Conducted Peak Output Power is 2.23dBm in lowest channel (5.745GHz);

The best case gain of the antenna is 2.12dBi.

EIRP= 2.23dBm + 2.12dBi = 4.35dBm

4.35dBm logarithmic terms convert to numeric result is nearly 2.72mW

According to the formula. calculate the EIRP test result:

$$\left[ \frac{(\text{max. power of channel, including tune-up tolerance, mW})}{(\text{min. test separation distance, mm})} \right] \cdot \sqrt{f(\text{GHz})}$$

General RF Exposure =  $(2.72\text{mW} / 7.23\text{mm}) \times \sqrt{5.745\text{GHz}} = 0.90$  ①

SAR requirement:

S= 3.0

② ;

① < ②.

So the SAR report is not required.

For Antenna 2: the nearest distance of antenna to the human ear is 11.9mm, as shown below:

The Max Conducted Peak Output Power is 4.35dBm in lowest channel (5.745GHz);  
The best case gain of the antenna is 4.23dBi.

$EIRP = 4.35dBm + 4.23dBi = 8.58dBm$

8.58dBm logarithmic terms convert to numeric result is nearly 7.21mW

According to the formula. calculate the EIRP test result:

$$[(\text{max. power of channel, including tune-up tolerance, mW}) / (\text{min. test separation distance, mm})] \cdot \sqrt{f(\text{GHz})}$$

General RF Exposure =  $(7.21mW / 11.9mm) \times \sqrt{5.745GHz} = 1.45$  ①

SAR requirement:

S= 3.0

② ;

① < ②.

So the SAR report is not required.
